Btw. I tried TenFourFox on my MacMini G4 with youtube and HTML5 video and it was pretty damn jerky (in 320p). And TenFourFox still has a lot of Altivec acceleration.

I wonder how they achieved so poor results then.

On a MacMini G4, H264/WebM 360p playback in WebKit/OWB takes about 80% cpu in plain cairo image surface mode (most of the time being spent in cairo), and 20% when using overlay mode. And Firefox/TenFourFox on OSX surely has some kind of HW acceleration for Cairo, so there's really no excuse...
