URL:

The idea is to redirect programs that use old and obsolete commands for playing CDDA to use `cdplayer.library` instead. The latest version of [cdplayer.library](#) is required for this.

CDDAPatch is implemented as a commodity and DOSDEV tooltype on icon is used to specify which drives should be patched (f.e. I have CD0: and ICD0: patched here).

The program has only so far been written and tested with the OS included PlayCD in mind but I will test with some other programs as well and if it works well enough I will eventually make a proper release of it.

Edit: Removed the DropBox link to alpha version. The program is now available at this [link](#) instead. I've also uploaded it to OS4Depot and Aminet.
