Added support for PLAY AUDIO (10) and PLAY AUDIO (12) commands and also some checking of the starting address before starting to play audio. Download link is the same.

This patch would have been really useful if released before, but i don't know now that PlayCD works fine also on Sam.

Personally I couldn't care less about PlayCD. I only use it to start with because it's a simple test case that makes use of many commands (play, pause, resume, stop, status).

The main reason for this patch is for semi-old Amiga games that use their own routines for playing CDDA tracks. F.e. with the latest version of CDDAPatch the CDDA playback in Exodus demo (Amiga Format CD 48) is working (not much else works though).
