Have you tried capturing a snoopy log whilst you cut & paste to see if something somewhere fails?

I hadn't, but it sounded like a good idea, so I wrote a text and started Snoopy. I was a bit shocked to see a constant stream of

Quote:

```
idesk : o.k. = [exec] OpenDevice("timer.device",0,0x4EE001C0,0x00000000) = 0 [33uS]
```

go by; seems like a waste of good processor time.

I asked for Failed operations only, copied the text, went to Sylpheed, and successfully pasted it!

That's sort of the story of my SAM460 experience so far. Just because something doesn't work today, it doesn't mean it won't tomorrow, or maybe the next day.
