- Menu aren't inside the program like Windows/Linux but they are accessible on top (standard menu in MacOS but also on AmigaOS of course)

As I pointed out (or tried to), the first release will be a straight out port. What can be done beyond that is something that we need to decide. Windows has the orange "Firefox" button and menus hidden by default. We have thought about the same thing, hiding the menus by default and having a normal AmigaOS menu for the functions you usually get via the Firefox button. The biggest issue are inlined menu images and the nesting depth, which might or might not pose a problem.

- The vertical scrollbar at the right are embedded like any other OSX "native" program, instead current Timberwolf's scrollbar (under AmigaOS4) is showed inside the window and not as a part of it ... it look like an owner Firefox widget instead ..

That's because it uses Firefox widgets. Straight port only. The widgets need to be CSS styleable, so you cannot just replace them with AmigaOS widgets. Some of them work, but right now, as I said before, stability and a straight port are the focus. Cosmetic changes are secondary, and will come after release.
