URL:

Update...

My system specs ... MicroA1 with 750 GX CPU and 256 MB RAM

Perhaps my problem is with RANDOM or not enough memory to run RANDOM and Timberwolf at the same time.

With RANDOM mounted and running and Timberwolf running ..

Web page update is fast, but every other action (including menus) seems sluggish, almost as if I am using a slow CPU or running in low memory conditions. Lots of disk activity as well.

If I use Timberwolf on my FFS2 partition ... sluggish.

If I use Timberwolf on my SFS partition ... sluggish.

If I use Timberwolf on my JXFS partition ... all operations faster.

Current configuration:

RANDOM in Storage (not mounted and not running)

Timberwolf on my JXFS partition ... all operations are fast.

With my current configuration, web page update is fast and all other operations are fast. The bookmarks I saved earlier are available at the bottom of the bookmark menu and they work.

This will suffice for now, because I do not have enough RAM to use Timberwolf to its fullest potential.
