If he gets VPDF to compile under OS4 with GCC, I'll gladly take a look at the source code and see what I can do. If it turns out to be too much work, the MUI version will always be there.

Currently i have compiled it for os4 with rewriting of hooks / removing some mos specific deps and so on, and gui kind of works already. I have some problems with core (which i think should be easy to fix), as i "just for test" replace their shared cairo and some others libs(which on morphos done as native amiga libs) with simply .a stubs, and just brutally change some moments which need to fix normally.

If you in interest, then why not, it will be nice to have and mui, and reaction versions. Through seeing on code, Kiero do a lot of work even for "just" gui : 130 kb of source code for GUI only (+80kb of toolbar images which done as C arrays as well). And thats only GUI, while there is also system-related routines, which are about 100kb of source code too, and some other parts there and there. Writing the same from scratch will be a long and boring way, for sure (yep, we can keep system-related part, but 130kb of gui sources are a lot).
