I'm skeptical that an *optional* plugin would count as a "combined/derived works to be published as a whole". But maybe not so clear-cut...

@kas1e

I don't think SObj's need to be "slow". I never tried, but I saw there is a compilation option for the "links" in an SObj to be resolved at "on demand" (at the point they would be executed), rather than the default of at load-time. That would basically make SObjs behave like libraries, except after the first use there would be no-more dynamic look-up (so it would actually be faster).
