URL:

I have Yam installed as well using Gmail as my primary Email provider.

There are settings at the Gmail end for how you want it to behave in the POP3/IMAP settings.

The trouble is anything marked "spam" is sent to the Gmail spam folder and deleted after 30days... "just in case" you spam mark something you want...

I'm willing to screenshot some settings and send those to you if you are interested?

but I have a small mountain of filters at Gmail as well as in Yam that work together...

Also Gmail keeps "archive" copies of Email until set to actually delete what it is told.
