Yep ! Fixing crashes one by one, some more progress:

[screen](#)

While screen can looks like "what, just a simple reg window?", that screen mean:

1. fully native os4 library
2. that library used from 68k binary (so 68k->ppc cross-call stubs)
3. generated .sfd/.xml/all includes/etc for native version of library (so, you for example already can start to write dopus5 based apps). And of course it all will works the same as it works from 68k binary
4. that "registration" window come from register.module, which is also 68k library (all modules in dopus5 is small libs), what mean, that we run 68k binary, which use os4 library, which use 68k modules (also libraryies) - what a hardcore mess and still all works !

So soon fix other moments, commits/cleanups, and then main program to 68k gcc, and then to os4. From all of this, mos and aros version will be not just trivial, but very very trivial.
