I was too huge fan of MUI-OWB but since a few days I reverted using OWB 3.32 from Joerg and I must admit that, even if I miss some fonctionnalities from MUI-OWB, I appreciate its stability over MUI-OWB (well, Kas1e's port of MUI-OWB since with the latest, I randomly get some crashes without any apparent reason, which is not the case with RA-OWB).

And I encounter the same freezes (GUI freezes for some seconds) from both ones.

Used with ClipDown and OWB AdressBook, I find them as easier to use.
