Last night work on Basilisk II.

Added B/W to full screen, convert B/W to 8bit mode, should be faster than converting to 32bit,
(not yet assembler optimized.)

Changed 8bit to use video buffer in full screen, due to problems when moving windows on X1000.
(Simple copy to screen, no endian conversion for now, probably going to use Picasso96 lock/unlock)
I'm thinking about making this an option.

GUI, frame skip and line skip can now not be negative values.
