@Andy

i got what chris say, but seems you miss main problem too : when i do not have libs:xad/lha, then unarc extract one lha archive fine, but dopus4 show fancy garbage in some places in very the same file. Question is : if both use the same inbuild in xadmaster, then why it different.

i know about bugs in inbuild. i want to know why there difference between unpacking via unarc and via dopus4 when inbuild unlha is used. with lha module all fine. i just want to know roots of difference in inbuild algo. maybe unarc have some filtering on garbage files and just skip them..
