@Andy

I worry only because want to know roots and to understand all stuff. :)

archives in question is those lha archives which packed by unix lha packers on unix boxes. for example yam , dopus5 and all others which packs on unix boxes. you can check it easy by grabbing yam nightly (or dopus5 one),remove for tests libs:xad/lha , and try to open/unpack on dopus4 and unarc.

my bet is that unarc filter garbage somehow, or skip strange files somehow..

@joerg

why unarc works different if also use xadmaster ? i mean it should be same, without additional code in, uts xadmaster should be updated, not unarc should have workarounds (as it now seems so?)
