Match is case sensitive, so %pdf will not work but %PDF will.

Most filetypes have a 'magic number' which is the first few characters in a file.

Eg. to match a png use:

Match \$89504e470d0a1a0a

the last 4 characters can not be entered from the keyboard so the 8 characters have to be given in hex code.

Jpg is ??????JFIF (the first 6 chars in the file can be anything, the ? means ignore this character).

Python scripts are:

Match (nocase) #!python

Or

Match (nocase) #!c:python

Or

Match Name *.py

IFF files are a little different, for those you use Match FORM and set it to AIFF, 8SVX, ILBM etc.

If you look on aminet you can find collections of filetypes for dopus5, you just need to update what to do with them eg. double click, drag'n'drop, popup menu entries etc.
