I hooked up a PC keyboard and mouse following suggestions.

Pressing the Scroll Lock button has no effect.

Boot up continued so I pressed the space bar. It accessed the U-BOOT Preferences Menu with Video Options, PCI-E 1x/ SATA-2, Boot Sequence and System Information.

In that case you're pressing the Scroll Lock key/holding down both mouse buttons way too early. You need to be pressing them after Kickstart loads, as the OS4.1 splash screen fades up. They need to be held as it gets to the brightest point. (edit: see video <http://youtu.be/1VDcDSG7jsU> )

If Kickstart isn't loading from the HD (as it clearly isn't from the CD) you've got bigger problems, and you need to explain exactly what is happening on a normal boot otherwise it's going to be impossible to diagnose.
