URL:

how to setup Qt and SMTube

SMTube is a standalone software, no need to have Odyssey to use it.

SMTube is a video viewer, therefore it doesn't use ffmpeg but MPlayer.

1) download the most recent Qt libs in the qt4.7-0.9.1-minimal.tar.gz package here :

<http://sourceforge.net/projects/qtamigaosnative/files/beta/>

and copy the libs/* and new Prefs/Qt program

2) DON'T FORGET to download the latest Qt libQtCore from Alkill and to install it in your Qt:Lib drawer

[http://sourceforge.net/projects/qtami ... bQtCore.so.4.7.0/download](http://sourceforge.net/projects/qtami...bQtCore.so.4.7.0/download)

3) go in Prefs/Qt and check "Native Paint Engine" in Painting tab to avoid to use OpenGL.

All others options are unchecked (at least on my system).

you can too, put the 2 first characters of your Locale in the "default language". "fr" for French for me

4) Read the SMTube ReadMe of course to customize the Amiga/PlayVideo.rexx

if you have a x1000/SAM460 without overlay, the Liveforit MPlayer (or MickJT SDL one) is the best MPlayer version.

5) go to os4depot and download Liveforit-Mplayer

6) put mplayer-altivec where you want and double-click once on it (to populate the APPDIR:mplayer-altivec)

7) in PlayVideo.rexx :

-change MPLAYER = "APPDIR:MPlayer" to MPLAYER = "APPDIR:MPlayer-altivec"

~~uncomment the first MPLAYER_OPTIONS~~

```
"MPLAYER_OPTIONS = "-cache 8192 -cache-min 20 -autoq 100 -autosync 30"
```

8) now you can start SMTube

9) hit the little screwdriver button at bottom of SMTube

-configure the quality of recording videos (720p MP4 for example) and Streaming Videos (480p webm)

Now you should be able to double-click on videos.

Update ;

If a video doesn't play you can try to force SMTube to update his YouTube script.

-delete Qt:home/.config/smtube/yt.js

-retry to watch the failing video.

-an updated SMTube YouTube code is downloaded.

-retry and enjoy !
