Have you checked out the svn first then cd inot the direcotory you checked out? There will be a .svn dir there if it is a working copy.

I think '*' is the wild card in svn. Becareful with it though as you don;t want to add object files to the svn usually and a wildcard night easily add those.

Be aware also that svn is built with linunix and uses unix style paths.

You can also add recusively, by specifying a directory rather than a file.

You will have noticed that you can do

svn help

and svn help <command>

to get help.
