Shorten or Compress a String/URL

Author: : djrikki

URL:

Hello,

If I have a long string which exceeds 8190 characters (the Apache default) that I would like to pass as a URL the HTTP server quite rightly complains.

What approach can I take to shorten or compress the string?

You should know that I am using Hollywood, I tried BaseStr64(), but that in fact made the string even longer much to my amusement.

I could split the data into several chunks and call the PHP multiple times, but that could be a re-write when I am sure there is another way.
