The current AOS third party implementation lets you write if you follow procedure and format and even fix it on the Linux side - as long as you managed the partition first on the AOS side and made it on a RDB. They changed something recently on the Linux side so when I have a ext3 partition on a MBR and try to write to it on AOS it says something about Inode 2 and that I can't write because of unsupported features. I think they changed something so the format command on Linux adds extra parameter/s.
