I own a monitor that supports 2560x1440 max.

When i let screenmode prefs do the setting, that specific screenmode won't work, the screen will stay black.

After much struggling i tuned down the frequency setting from 60Hz to 56Hz and et voila it works.

Problem is, that screenmode prefs still persists on 60 Hz (if i use the automatic setting) so i had to change it manually in the monitor file's tooltypes:

```
MODE=2560x1440@56
```

Screenmode prefs "incorrectly" reports it as 57Hz and all the 60Hz modes as 61Hz so i see a bug in the prefs program.

Try to manually change your setting to 55 Hz, reboot, see if that works and move up to the closet setting that works for you.
