I've tested it successfully with a 4,546,701,312 bytes image file.

Thanks.

You can remove everything after the StackSize line from CD1 and CD2, the "Control" options in these mountlists are only supported by CacheCDFS and are ignored by CDFFileSystem.

You should use different names for the diskimage.device mountlists, if someone has 2 CD/DVD drives installed he has a CD1: already, and on classic Amigas at least DF0: is always there (unless the floppy drive is broken).

Done.

An icon for DiskImageGUI should be included, even if it's just the def_tool one, if you put it into SYS:WBStartup without icon it's not started.

That was a mistake. There should have been an icon, except I forgot to include it in all three releases I've made

up to now. The icon I'm using is the def_disk one.

Thanks for pointing it out. I probably wouldn't have noticed it otherwise.
