@Hans

Yep, that your article is nice, and add2line is welknown, its just i choice to avoid mambo with addr2line, as well as its easy for copy+paste/forwarding/etc crashlogs when they have names of functions insted of reference values, which i need manually translate and loose time for.

@ChrisH

-gstabs just recommented by core devs on os4 (dunno why, maybe they have reasons for), but its about the same as -g. On linuxes -gstabs produce debug binaries without GDB extenstions, while -g produce debug binaries with GDB extensions. It can be that our old GDB do not handle any special GDB extensions, so for us its all the same, -g or -gstabs.

@Raziel

When i see something swapped around (like mirrored on your image), i always think about endianes differences. But i can be wrong. Its always good to compare morphos version on the same sites if anyone have ability to do so, so to know if it non os4 port specific problem
