Removing all gfx card related settings didn't help.

Setting "amiga_model = A4000/OS4" instead of "amiga_model = A4000/040" made the booting go into never ending loop with blue flashes. "amiga_model = A4000/PPC" works the same as with "A4000/040".

Yes, I have those qemu plugins. I didn't put the full config file here.
