I don't know about others, for me ever since the move to FE + latest driver + latest Candi I didn't have a single issue. I've been using it alongside some pretty heavy loads: mplayer, uae, scummvm opengl fullscreen, odyssey etc. It might be unwise from a performance perspective while we each have our own priorities and that is why I talk about a heavy load condition (which I don't get regularly only on specific occasions like I said here). In addition, I did have issues with it and the new Notification Server since installing the enhancer package. Had to delete it + settings a couple of times before it finally worked okay. I think that was more regarding start/stop commands and what triggers notifications.

It doesn't matter, like with js I will test NS without Candi (or anything else) for a week or so and report back.

Regrading WebGL, it didn't help FF on linux being any less slow on the X1k. It's important not to mess too much with what basic design NS has that makes it go fast or what makes odyssey keep up with mainstream sites despite it being outdated.
