Which window manager do you use? Still Openbox?

Yes, it's Openbox (no panel, no toolbar).

Quote:

Can you try to launch the panel by hand after startup by typing "lxpanel" into a shell? (stack min. 1000000). Does it also crash?

It's like a random thing : now it crashed idesk, just before the launch of the wm! It's surely curious and seems random DSI errors, that will not appear in older OS versions (never bothered me in 4.1.6).
Anyhow, I managed to run lxpanel from shell with stack 1000000 and no crash.

{edit}

Too eager to post!

It crashed on a second try, so no luck.

Here is the shell output after the first try :

```
** (lxpanel:355): WARNING **: Invalid borders specified for theme pixmap:  
/Cynix/CynixPPC/gtk2.24/share/themes/Amiga-BlueTabs-Light/gtk-2.0/menu_hi-light.png,  
borders don't fit within the image  
__cynix_execv_new(): attempting to execute 'Cynix:CynixPPC/X11R6.3/bin/xshutdown'  
The application 'lxpanel' lost its connection to the display localhost:0.0;  
most likely the X server was shut down or you killed/destroyed  
the application.
```
