I can't make a direct comparison to JosDuchIt's setup because I use a custom script to start AmiCygrix from a shell but a quick test of starting AmiCygrix and running AbiWord didn't cause any crashes. Since others have reported AmiCygrix working too, maybe JosDuchit needs a reinstall of AmiCygrix.

I did notice several things:

AmiCygrix is adding several environmental variables including a PATH variable. Other programs (Linux ports?) set the same variable to a different value. Check the topic "CMake progress" here on Amigans.net and you will see that people are being told to set a completely different PATH variable. I recommend changing all the AmiCygrix variables to something like "CYGPATH" or similar.

If I run Snoopy after AmiCygrix has started and I open AbiWord I see this constantly repeated:

```
lxpanel      : o.k. = [exec] FindPort("XGeekTransPort.0") [2uS]
```

```
openbox      : o.k. = [exec] FindPort("XGeekTransPort.0") [2uS]
```

Is that really necessary?
