xdummy seems to crash while loading the settings, no idea why.

I suggest to make a clear new install of AmiCynix for testing somewhere else. Before this make a backup of your "s:user-startup" file and remove the AmiCynix stuff from it (everything between ";BEGIN Cygnix" and ";END Cygnix").

After a reset install the AmiCynix 1.3 and the AbiWord package on a drive with enough space. Maybe it works. To switch to your old installation, just replace the user-startup with your old file.

Esetroot crashed while opening the "cacheclearu.resource". I cannot find it on my system. Does anybody know, what it is??
