Hi, I've no idea why my printer is labelled 8615, the software (webserver) and manual refer to it as 8610, According to the user guide (page 182) they have a PCL3 GUI.

Network: Using this; http://os4depot.net/share/utility/print/lpr_dev.lha

place the device in SYS:Devs, you will also need a small config file in SYS:Prefs/Env-Archive.

Type into an editor, HOST "IPaddress your printer" RAW, this is mine, "HOST 192.168.0.4 RAW" and save it as "lpr.device".

In SYS:Devs/NSDPatch.cfg (scroll to the bottom) the last two lines are modified to this:

```
DEVICE parallel.device UNIT 0 MAPTODEVICE lpr.device MAPTOUNIT 0 MACHINE=AMIGAONE  
DEVICE a1parallel.device UNIT 0 MAPTODEVICE lpr.device MAPTOUNIT 0 MACHINE=AMIGAONE
```

In SYS:Prefs/Printer, for Port device: I have lpr.device selected, as I'm using TurboPrint I've left the printer driver as "Generic".

Oh, and if you want to connect to the printers Webserver via an amiga, Odyssey crashes the printer, Timberwolf does not.

Hope this helps, Draby
