The reason the prefs file is saved so many times is to catch listbrowser column resizing, resizing of the panes (no signal from ReAction when do that), etc. It will be improved over time.

I did not realise it wrote to EnvArc regularly (especially if nothing has changed), but I don't like the idea - it's not at all "Amiga-like". (Also it's not such a hot idea if someone is using an SSDs on the Amiga.)

Most Amiga software only saves column resizing (etc) when the program quits (or user snapshots), and IMHO that should be sufficient for such superficial (GUI) changes.

If there is some important use-case (I can't imagine what) then make it an option...
