Works fine here.

I was able to reproduce Raziels' snapshot issue and I think it's a Reaction issue (not an AmiPDF issue) which may be a feature; not a bug. Here are the results of some testing:

When AmiPDF is started from it's icon, snapshot saves the window position here:

```
ENVARC:Sys/WindowData/AmiPDF/AmiPDF.xml
```

When AmiPDF is started from a shell, snapshot saves the window position here:

```
ENVARC:Sys/WindowData/Shell Process/AmiPDF.xml
```

In other words, the location where the window position is stored depends on how the program is started. I tested a number of other programs that have the "snapshot" feature and they all save the position in a different location depending on how they were started.

I did find one potential problem snapshot problem when USBInspector is started from a shell. The name of the window position file is "MAIN_Window.xml". It seems to me like the filename should contain the name of the program to avoid conflicts with other program snapshot files,

EDIT: It might be smart for programmers to test snapshot from shell and icon start to be sure the snapshot filenames are correct.
