While I haven't read all of it yet, it comes across as pretty positive so far. But I have spotted a couple of mistakes:

- \* The article claims that "memory protection" was added in 4.0 ! Maybe he meant virtual memory (actually paged memory) in 4.1?
- \* He says there is a "MagicWorkbench" GUI development library, when I assume he means "Magic User Interface"!
- \* Apparently "Hyperion and A-EON have released a tool called RunInUAE", but I shall forgive the mistaken attribution 😊
