Yeah, article kind of positive, but a bit misleading in some parts as well :)

Imho, should be bolded the phrase "while you can install gfx cards with any amount of memory, and can put a lot of GB of main memory, os still don't have ability to use more than 256mb of video ram, as well as can't use more that 1.8gb of main memory with some exceptions".

Then, there will be much less positive comments under article :) Ppls even now say "damn, how expensive" and co, but they do not know that half of hardware not utilized by OS :)
