I've started working on an AmigaOS shared library implementation of libpixman.

The source code (based on pixman 0.34.0) which compiles already but is otherwise untested is available on github:

https://github.com/salass00/pixman_lib

Next on my to do list after first ensuring that the library works correctly is to look into enabling altivec support either in a separate build of the library or if possible as part of the same build, as I did with [xvidcore.library](#).

Libcairo relies more on global data than libpixman so I will probably build it only as a static library to begin with (basecel support is missing from current adtools gcc versions and I don't quite understand yet how to use the small data mode to do the same).
