@K-L

I did read the suggestion about block size 512 somewhere, so I started using that block size, later when problems occurred and as during installation, when you format the partition, 1024 is proposed by mediatoobox, I did try that block size. It was neither better or worse I think  
It is strange that the install procedure does not insist on using 512 bytes.

I reasoned that with bigger and faster hd's a larger block size would be logical. The size for the SWAP partition is mentioned in full in the procedure: it should be 4096

I am interested in the logic of using 512 for the OS partition

@chrish

I switched the dvd and the HD SATA cables. I am not sure if there is some progress.  
I can boot from DVD or HD but my u-boot messages don't appear any more
