@stonecracker

I had a chance to try and build it today under latest version of UWIN and unfortunately it still fails.

I think I understand the issue but not sure yet how to fix it. Looking at output the failure is when g++ invokes the assembler that has just been built. The newer versions of "g++" set the command line option of --64 to newly built "as" since it is a 64 bit environment. The version of "as" that is built does not support --64 and it kills the build.

So looks like we need a newer version of binutils?
