Yes, i've done by typing `./configure --host=ppc-amigaos`

Just looked up [some docs](#), and it should be something like:

`./configure --target=ppc-amigaos`

Note the `--target`, instead of `--host`. `--host` is supposed to indicate the platform that will be used to compile, whereas you want to set the platform that it will build for.

I'm not 100% sure about this though, because some examples use the `--host` and `--build` parameters instead.
