--target is used to tell the compiler what architecture to compile for, not to choose the compiler itself. So in that case, you're asking an x86 compiler to make a ppc-amigaos architecture binary. It's not able to do that.

--host is used to specify which hosted environment/toolchain to use, like a prefix. It's confusing.

--build is used to specify the architecture of the actual system you're doing this all on (I've not had to use this).

<https://gcc.gnu.org/onlinedocs/gccint/Configure-Terms.html>

So, the correct flag is --host=ppc-amigaos
