Well, you're more experienced than me in this stuff...

That said, someone really needs to clarify the terminology and make sure that configure scripts stick to it. Because even what you said doesn't match the document you linked to 100%, which says:

Quote:

the machine you are building on (build), the machine that you are building for (host), and the machine that GCC will produce code for (target)

and

Quote:

Specifying the host without specifying the build should be avoided, as configure may (and once did) assume that the host you specify is also the build, which may not be true.

I've seen conflicting examples too. SOme use --target, others --host, and some set all three including [this one for SDL2](#).
