Thanks. In this case we're trying to help AmigaBlitter get SDL2 compiled on his cross-compiler setup. So your input is helpful.

Sorry, thought the thread was still about compiling the compiler, that's what I get for not reading the whole thread and jumping at the end.

The example SDL config you linked too earlier is surely the way to do it then.

or without variables

```
./configure --host=ppc-amigaos --target=ppc-amigaos
```

configure should work out --build for itself on any sane system (assuming you intend to run the resulting make on the system you ran configure on)
