"I don't know if it's been mentioned yet, but SDL2 can't be compiled with SDK 53.24 which is what is installed by the adtools Makefiles. You need 53.30."

Yes, that's the reason why i burned out my (sigh) unique functional UWin installation, cause SDL2 needed the 53.30 version of the SDK. The first installation of the UWin worked fine and configured SDL2 ok, targeting ppc machines. The SDL2 compile started ok, but halted showing errors related to the SDK version.

I think the problem is not related to SDL2 only. The problem is related to the UWin installation.

The problem could be related to symlink and paths.

I will post the EXPORT, PATH and SET outputs asap.
