Slightly different thoughts....try any or all of them.

1) It may be that you've got a dead/missing symlink in your /usr/local/amiga directory. As in, you might be missing the "/usr/local/amiga/adtools" symlink that some things rely upon in the build instructions. Start with confirming/creating the symlink. If it's not there, "sudo ln -s /usr/local/amiga/adtools-ppc-uwin64-20170623-404 /usr/local/amiga/adtools"

2) I've still not tried to do the compilation of the SDL toolkit, but I wonder aloud what might happen if you replace just the UWin gcc executable in its normal /usr/bin/gcc location with a symlink from:

```
/usr/bin/gcc -> /usr/local/amiga/adtools/bin/ppc-amigaos-gcc
```

Then:

```
gcc -v
```

If that gcc command actually now calls the ppc-amigaos-gcc executable, how does your SDL build behave?

3) Do you have another Windows PC? Or even a VirtualBox clean Windows image you could use to try with some clean slate?
