I have bought the Gigabyte K83 Mechanical keyboard, and it is having problems with the X5000.

When connected to the X5000 i get an error when the machine boots into OS4.1 FE. Sometimes the keyboard is just not responsive or detected at all.

The weirdest thing is when connected to the X5000... the Uboot screen with boingball is in Accelerated mode... the boingball spins factor 5..

For now i would not recommend buying this keyboard...
