Given your question about which MPlayer is being used, one item of note...

I forgot that YT.rexx was initially set up using APPDIR: paths to MPlayer and FFPlay (in my system, I set them to explicit paths for manual control and testing purposes).

In case you didn't know, the "APPDIR:" path in "APPDIR:MPlayer" is a "virtual" path to whichever version of MPlayer that was last run.

In general that works fine for most users as long as you're not changing programs a lot and/or doing a lot of testing.

With APPDIR: if you move MPlayer or create a new install and then run it just once (from the command line or Workbench), then YT.rexx will automagically also be running that MPlayer.

Obviously, it's not a good thing if you test some new version of MPlayer and that's not working. APPDIR: will mean YT.rexx will also be using that bad version until you go back and manually run the known-good version again.

Fun fun fun!

Good luck,

PJS
