So, I've downloaded it..

Started compiling with the install, it was compiling fine some time, until my computer locked before completing the whole compilation.. Not sure what or if it was gcc or Odyssey that caused it, but I will try to compile it again later as it took some time... 😞

Anyway, I went ahead and compiled the hello source, it worked fine!

I also tried the Triangle source, yes it worked too!! Cool!!!

So far looks impressive already, I'm looking forward to updates and getting some time to get my hands dirty in trying out and coding in BlitzMax 🍷
