I was playing with the prebuilt shared object on OS4Depot.

I got it to load and bind functions. Got the proper calls in place for the constructor/destructors so cleanly loaded and unloaded.

I dont have source handy but it crashed in stack trace in pthreads call. It was basically open the device close it. Died on the open.

I tabled it until I had more time to look at then saw this thread here about you reworking it.

I'll build from your git repo and retry and show my simple example.

Thanks

Doug
