Make a copy of the monitor driver or look in storage to see if a suitable monitor driver is in there.

It doesn't matter what you call board name. It's seem to just be an identifier used in the monitors tab of screenmode prefs.

You should be able to activate the monitor driver by double clicking on it. When testing don't put the monitor driver in monitors, just in case it hangs the system and you end up with the system hanging on boot up thereafter.
