E-UAE SDL now works

I've done various tests with the SDL version, it works very well with almost all the games and demos written in assembly.

At the moment the X1000 version seems to be faster in some games.

If I can report a few small bugs or anything, I would like it, if it can be useful.

It would be nice to try new beta.

Thanks again!

here a little video while I use the SDL version with 64bit winUAE:
