Does LiveForIt-MPlayer 6.5.7 work?

<http://os4depot.net/share/video/play/liveforit-mplayerng.lha>

When using 6.4, check the shell output and see if it's really using comp_yuv2 or just comp_yuv (or just comp).

Altivec or non-Altivec? Does it crash, freeze, or something else? DSI/ISI? Empty window? And do test LiveForIt-MPlayer 6.5.7. It's closest to mickjt-mplayer.

@mufa

You didn't mention which version of mplayer you were trying to run, and whether it's for altivec or not. Paste all the lines that say something like "VO: [somethinghere] text here".

Version 6.4 doesn't have the same checks that later versions do.

In later versions there is a check to see if RadeonHD.chip is being used, and I suspect that check is failing with RadeonRX.

You'd then see something in the shell like:

VO: [comp_yuv2] You need RadeonHD to use this video output.
