Some update....

I can see for 2 years now I had no SATA cable connected to SATA0. My main HDD has been on SATA 1 port. Not sure if that makes a difference.

So the SSD was connected to SATA0 when I installed the new OS.

I did just switch and made the 2 year old HDD drive connected to SATA0 port and the new SSD SATA1 but same thing... uBoot selector only boots to new SSD if both drives connected even when I select the old one in uBoot selector screen.

I may try to install the new OS again on the SSD while it is connected to SATA1 but before I waste time and spin my wheels... maybe someone knows why this may not be working for me.

Thanks

TJ
